Biophys. Struct. Mech. 1:139-146(1975).
-!- MISCELLANBOUS: The structure of the V region was determined by molecular replacement methods using the known structure of the V region of the kappa chain REI.
-!- MISCELLANBOUS: The C region of this chain has the INV (3) marker.
-!- MISCELLANBOUS: This is a Bence-Jones protein.

"Complete genome sequence of the alkaliphilic bacterium Bacillus halodurans and genomic sequence comparison with Bacillus subtilis.";

Nuclaic Acids Res. 2814317-4331(2000).

-I. FUNCTION: Site-specific tyrosine recombinase, which acts by catalyzing the cutting and rejoining of the recombining DNA molecules. The xerC-xerD complex is essential to convert dimers of the bacterial chromosome into monomers to permit their segregation at cell division. It also contributes to the segregational stability of plasmids (By similarity).

-I. SUBUNIT: Forms a cyclic heterotetrameric complex composed of two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Publication of the property of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

T a novel context for the 'MutT' module, a guardian of cell integrity,

In a diphosphoinositol polyphosphate phosphohydrolase.";

ENBO J. 17:6599-6607(1998).

-!- FUNCTION: Cleaves a beta-phosphate from the diphosphate groups in

PP-INSPS (diphosphoinositol pentaxisphosphate) and [PP]2-InsP4

(Disdiphosphoinositol tertakisphosphate) and [PP]2-InsP4

(Disdiphosphoinositol tertakisphosphate); suggesting that it may

play a role in signal transduction. InsP6 (inositol

hexakisphophate) is not a substrate. Acts as a negating the

confine ERK1/2 pathway. Also able to catalyzes the hydrolysis of

dinucleoside oligophosphates, with Ap6A and Ap5A being the

preferred substrates. The major reaction products are ADP and D4a

from Ap6A and ADP and APP from Ap5A. Also able to hydrolyze PRPP

C. Catalytic ACTIVITY: Diphosphate + phosphate.

Myo-inositol polyphosphate + phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -i- SUBUNIT: Monomer.
-i- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-i- SIMILARITY: Belongs to the Nudix hydrolase family. DIPP subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Direct protein sequencing; Hydrolase; Magnesium, Metal-binding.

```

Sequence 9 AA;

from

Spleen cells from mice immunized with human IL-4 were used to prepare hybridomas, which were screened for anti-IL-4 MAb secretion. Only clone

Disclosure, Page 56; 97pp; English.

```
3B9 was positive. cDNA clones of the 3B9 light and heavy chains were cloned into pGEM7f+ and transformed into E. coli DH5-alpha. A light chain cDNA clone was sequenced (AAQ83490) that encoded the protein given in AAR70189. 3 CDR8 (AAR70195-97) were identified. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New DNA molecules encoding recombinant antibodies useful for treating IL4-mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a complementarity determining region (CDR) of the light chain variable region of murine interleukin-4 (ILL-4) antibodis 3B9. The specification describes chimeric and humanised ILL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating ILL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic refinitis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, host-versus-graff disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess ILL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Light chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin B-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic astehma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy;

an epitope specifically bound by an antibody expressed by a clone such as clone $25, C25, C39, IC6 and clone 1F3, where the antibody binds to and neutralises botulinum neurotoxin type A (BONT)A). Also included are a polypeptide comprising BoNTA neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H of fragment and making an anti-BONTA antibody that neutralises BONTAA by contacting several antibody expressed by any of the nepitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically binds to the pitope and isolating an antibody that specifically binds to the copitope). The antibody is useful for neutralising a BONTAA, by contacting botulinum neurotoxin type A with the antibody comprising VH CDR (heavy chain variable region complementarity determining region) and with a second anti-BONTA antibody which comprises a VH CDR, where the second antibody. The antibody that the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection diagnosis of botulism and in the detection and/or rapid cute in indicative of a Clostridium botulinum infection of the organism which is indicative of a Clostridium botulinum infection of the organism chain antibody. The present sequence is a light chain variable region (VL) of a single

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a light chain complementarity determining region (CDR) from an antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (II4) monoclonal antibody for the treatment of immunoglobulin B (IgB) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
